

Sensors don't decide. Sentinel does.

Every layer has one job: sensors report facts, a classifier names them, and one engine holds the whole policy.

LAYER 1 · SIGNALS

*Senses - Never
judges*

MonitoringService

Watches the camera, finds faces and checks them against the enrolled user. Reports `authorized_user`.

TrustedNodeService

Listens for the trusted anchor and checks its identity and signal strength. Reports `node_signal`.

LAYER 2 · EVENT SERVICE

*Classifies - Never
judges*

NONE

ON_OBSERVER

ON_NODE_LOSS

ON_USER_ABSENT

ON_UNSECURE_ENV

A label, not a value — and several can be true at once.

LAYER 3 · SENTINEL

*The only decision
maker*

decide(state, events) → (state, commands)

One pure function holds the priority order, the single user-set timer, and every escalation path.

LAYER 4 · ACTIONS

*Executes - Never
judges*

Notify

Popup and audit entry.

Contain

Overlay, minimise, block input.

Lock

Hands the machine to the system lock screen.

STATE MODEL

BASELINE

SCANNING

Verified user present.
Nothing is hidden.

← ON USER ABSENT PRIVACYMODE

App-level containment.
The camera clears it the moment you return.

← ON UNSECURE ENV LOCKDOWN

The real OS lock. Windows credentials only.
