

CONTINUOUS AUTHENTICATION

Watchdog for the untrusted workspace.

Your desktop verifies who is sitting in front of it — every few seconds, on-device, with no network and no cloud. When verification fails, the screen protects itself.

THREE WAYS A WORKSTATION IS EXPOSED

01 ABSENCE

You step away from the desk.

Open windows minimise, and keyboard, mouse and USB input stop responding. Everything goes back to normal the instant your face returns — no password, no interruption.

02 OBSERVER

Someone behind you looks at your screen.

If an unknown face keeps looking for `n_seconds`, the screen shows a warning and the event is recorded. A quick glance never counts.

03 ENVIRONMENT

The machine leaves its trusted area.

A small wireless node travels with the desk and marks where the machine belongs. If the node goes out of range and no approved user is present, the machine locks itself.
